## Windowing/View System

### General Graphics Controller

- Creates Frames (i.e. windows)
- Creates Components (i.e. views)
- Passes image data to Image Renderer
- Passes text to Font Renderer
- Passes shapes to Polygon Renderer
- Allows selection (focus) for frames and components
- Deletes frames and components physically from display
- Traverses object hierarchy when a paint method in a view is called
- Handles mouse and keyboard events "passing" them down through a chain of frames and components

### Window Manager

- Draws windows using polygon draws in the Polygon Renderer
- Manages windows so they can overlap
- Determines frame that event occurred in and notifies appropriate layout manager instance that it may need to update
- Oversees container hierarchies within each frame

### Layout Manager (belongs to / is referenced by a Frame)

- Manages container hierarchies within a frame's scope
- Determines container that event occurred in and tells it to update if necessary

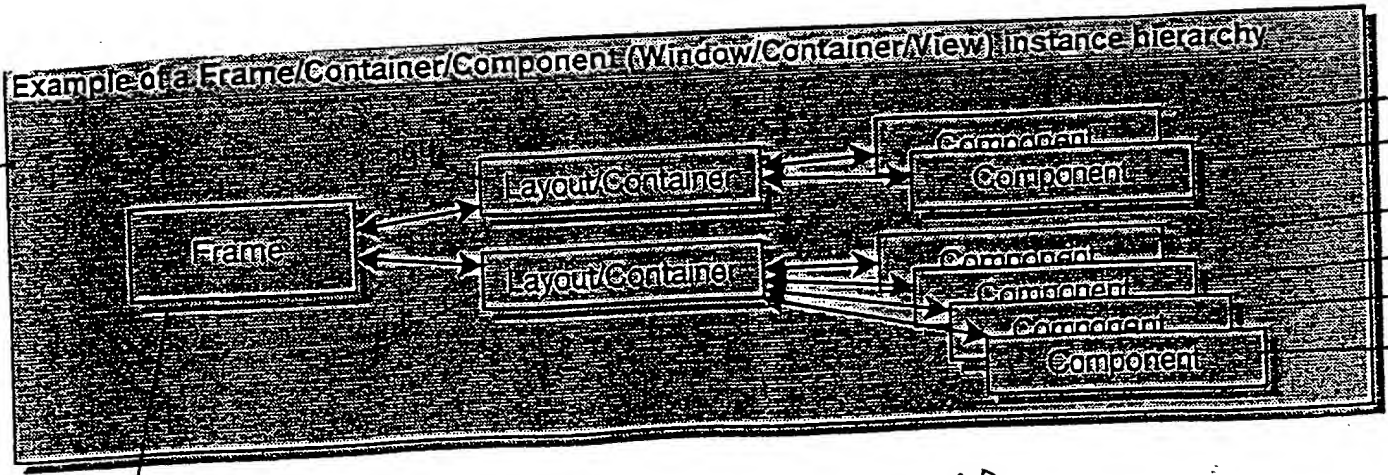

### Component Manager (belongs to / is referenced by a LayoutManager/Container)

- Manages component hierarchies within a container's scope
- Determines component that event occurred in and tells it to update if necessary

Networking System

FIG. 20

Network Controller

Signals DNS queries  
 Signals socket creation (allows multiple simultaneous sockets)  
 Conducts Network Input and Output  
 Signals closing of sockets  
 Operates as an abstraction layer over TCP and UDP protocols  
 May operate either synchronously or asynchronously

Network Query Mechanism

Performs DNS lookups and reports result to the Network Controller

Socket Manager

Manages sockets in use by applications (Opens and Closes them)  
 Determines container that event occurred in and tells it to update if necessary  
 Transfers socket status when requested up to the Network Controller

Stream Manager

Shuttles character/stream based input and output over the TCP/IP or UDP link  
 Offers a choice of input/output streams that differ for the application's use  
 Transfers buffers when requested up to the Network Controller
